

Name : Darekar Sanket Ravindra

Batch : 9-10 Data science and data analytics (IIT Batch)

Greetings and thank you for giving me this opportunity.

My name is Sanket Darekar, and I am from Pune. I completed my Bachelor's degree in Electronics and Telecommunication Engineering from Savitribai Phule Pune University. My engineering background helped me develop structured problem-solving skills, analytical thinking, and a systems-oriented mindset.

During my academic journey, I developed a strong interest in Data Science and Artificial Intelligence. Over time, that interest evolved into a focused passion for Generative AI and Agentic AI systems, particularly in how Large Language Models enable reasoning, automation, and intelligent decision-making.

Rather than limiting myself to theoretical knowledge, I focused on hands-on implementation.

One of my key projects is Audible Vision, an AI-driven accessibility system.

Situation: I wanted to explore how AI could improve accessibility for visually impaired individuals by helping them understand their surroundings in real time.

Task: The objective was to design a system capable of performing scene interpretation, text extraction, and converting that information into meaningful speech output.

Action: I built the system using Python and integrated Gemini 1.5 Pro for scene understanding, combined with OCR for text detection and text-to-speech APIs. I focused on optimizing response time, accuracy, and system reliability.

Result: The system achieved 92% scene recognition accuracy and 95% text detection accuracy with a response time under two seconds, significantly improving information accessibility and user autonomy.

Through this project, I gained strong exposure to multimodal AI systems, LLM integration, and real-time AI pipeline design.

From a systems perspective, I am also familiar with modern deployment and backend ecosystems such as Vercel and Supabase. While I am continuously deepening my hands-on experience with these platforms, I understand their role in authentication, database management, and scalable hosting for AI applications, and I am comfortable adapting quickly to production environments.

What differentiates me is that I think beyond prompts — I focus on architecture design, evaluation, scalability, and adaptability. I approach Generative AI from both a model experimentation and system engineering perspective.

Alongside technical skills, I strongly value teamwork and collaborative problem-solving. I believe impactful AI systems are built through shared ownership, structured iteration, and continuous feedback.

Although I am at the beginning of my professional journey, I bring curiosity, discipline, adaptability, and a strong growth mindset. My goal is to contribute to building intelligent, scalable Generative AI systems that create meaningful real-world impact.

Thank you for your time. I look forward to the opportunity to contribute to your team.
